Pull from a repository

Select your PC environment:

| Windows	Mac	Command Line

In this section, we are going to pull the latest change from the remote repository to our local repository (tutorial directory).
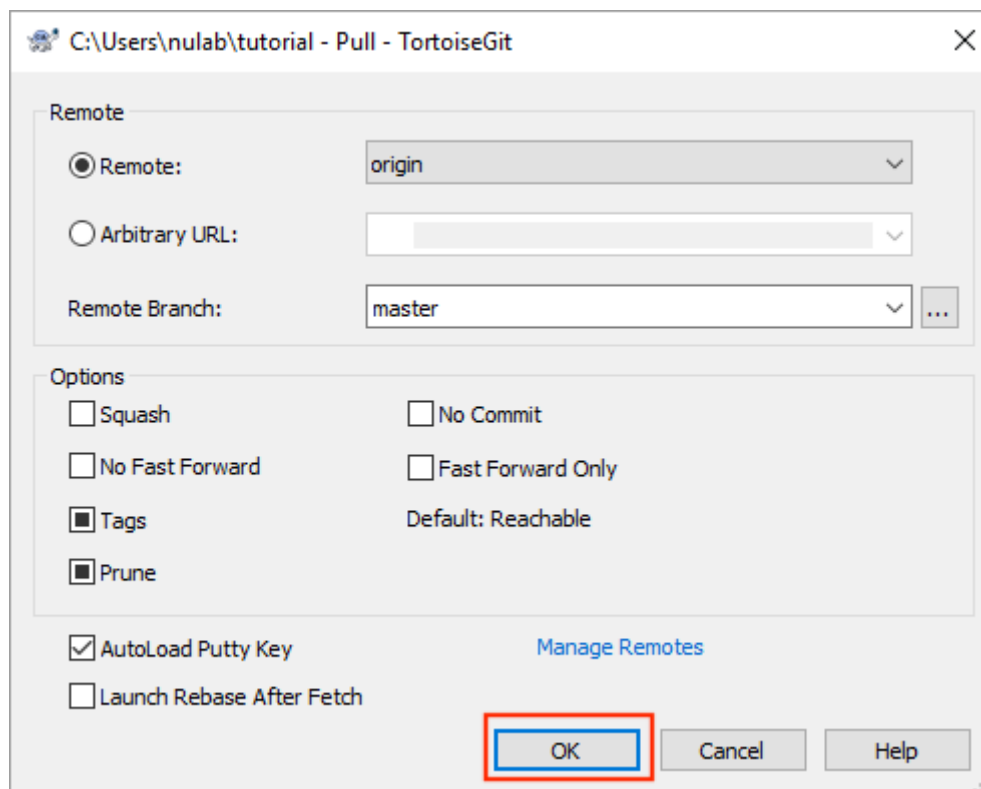

Windows

Now that our remote repository is up to date with the changes from "tutorial2", let's pull the change and synchronize our initial repository directory, "tutorial".

To execute a "pull", right-click on the tutorial directory and select pull from the right-click menu.
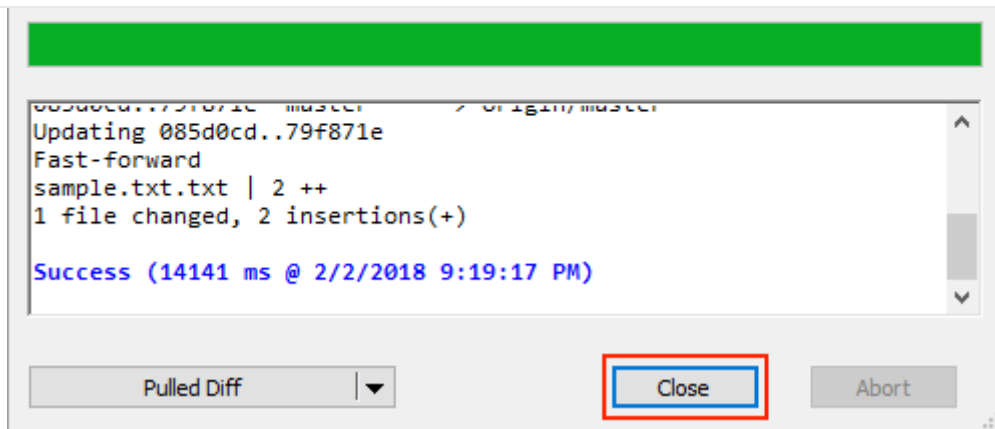

**Git Tutorial**

Click "OK".

Pull will be in progress. Once complete, click "Close" to finish.

Git Tutorial

Click TortoiseGit > Diplay Log from the right-click menu. You will now notice that master has moved forward to the same level as origin/master. This means that our tutorial local repository is now up to date with the latest changes from the remote repository.

Git Tutorial

Let's open the file sample.txt and check the content.

```
Git commands even a monkey can understand
add: Register a change in an index
```

We should see the newly added content "add: Register a change in an index"
